

FISCAL INCREASING RETURNS, INVESTMENT
AND INTERNATIONAL CAPITAL MOVEMENTS

Andrés Velasco
New York University

May 1991

Abstract This paper introduces the possibility of fiscal increasing returns to domestic capital into a dynamic model of international portfolio selection. The resulting model displays multiple steady states and surprising dynamic behavior. Cycles of any length can occur around the welfare-inferior equilibrium. Initial conditions and expectations both matter in selecting the equilibrium (or cycle) on which the economy converges.

I am grateful to the C.V. Starr Center for Applied Economics at New York University for logistical support, and to Jess Benhabib and Aaron Tornell for useful conversations.
